Setup for Project 6 notes (what we failed to record in the Q&A this week)

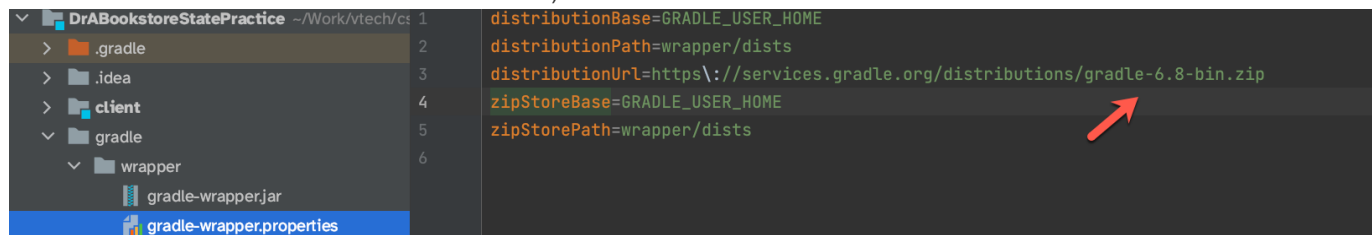

Folks,

As promised here is what we failed to record early in the Q&A this week.

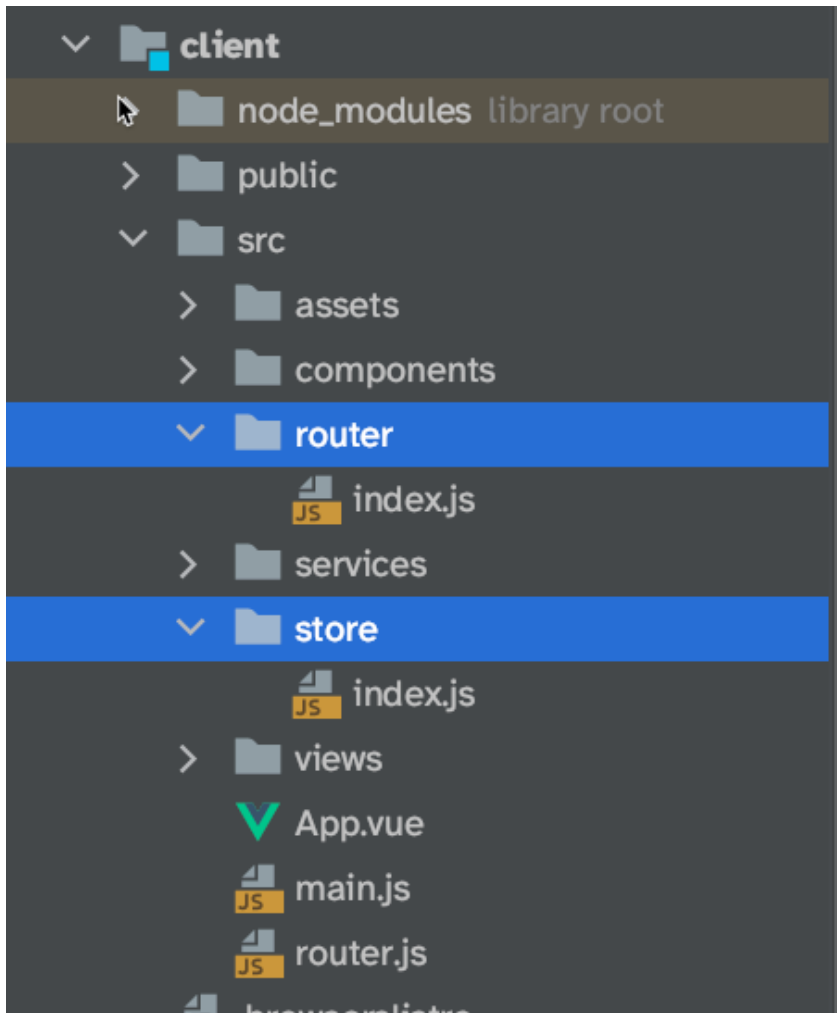

After you copy Project 5 server into project 6, remember to delete the old website code inside the src/main/WEB-INF folder:

Make sure you are using gradle-6.8 in your gradle/wrapper/gradle-wrapper.properties file on the server: (latest IntelliJ default to Gradle 7 which causes more issues than it is worth):

Remove the router and store folders - we just need files for our small website. These folders are useful if you get a larger website and need to have multiple files to implement the store. We don't need that facility.

Hope this helps.

Thanks for the help Dr. A.

Just to be absolutely sure... we're getting rid of the router and store directories, and the index.js in both?

And lastly... I think you had intended on pinning this, but you typed pin with two p's so it didn't get pinned. At least that's what I suspect happened.

Steven Atkinson 1 month ago Yes remove the index.js files.

Thanks I'll fix it.
